

Hi,

I've completed both tasks from the assignment and wanted to share my submission.

Quick summary of what I did:

For Task 1, I wrote a Python script that scrapes laptop listings from amazon.in. It collects the product title, price, rating, image, and whether the listing is sponsored or organic. The results get saved automatically into a CSV file with a timestamp in the filename. I managed to pull 48 products across 3 pages.

For Task 2, I went with the Face Authentication option. I built a FastAPI service that takes two face photos, runs them through the FaceNet model using DeepFace, and tells you whether both images are of the same person or different people. It also returns a similarity score and the bounding boxes of the detected faces. I've split the code into two files as mentioned in the requirements — one for training/setup and one for prediction.

I tested everything end to end and it's all working fine. Let me know if you need me to walk you through anything or if there's something you'd like me to change.

Thanks for the opportunity, looking forward to hearing from you!
